TITLE: The adrenalin, noradrenalin and phenamin effects influenced by tofranil

PERIODICAL Zhurnal nevroptologii i psikiatrii imeni S. S. Korsakova, v. 62, no. 2, 1962, 183-189

TEXT: The present study deals with the effect of tofranil on the central and peripheral adrenergic processes as well as on the central effect of phenamin (benzedrin). The experiments were carried out on cats and rabbits. The methods and techniques are described. In addition, the effect of tofranil on the group toxicity of phenamin was examined on albino male mice. It was found that the sensibilizing effect of tofranil to adrenalin and noradrenalin was not present in rabbits; therefore it was deduced to be an effect specific to certain species. Nor was this effect found in cases where the cocaine effect had been successfully applied several times. As far as the central effect of tofranil is concerned, it increased the motor excitatory effect of phenamin. The authors conclude that this fact indicates the adrenergic mechanism of the central effect of tofranil in addition to its central analeptic effect. It was also found that tofranil and phenamin act synergistically. The different effect of small and large doses of tofranil on group toxicity of phenamin was assumed to indicate that the dual (positive and negative) effect of tofranil on adrenergic structures at the periphery was carried out also through the adrenergic synapses of the brain.

TITLE: The Employment of the Colorimetric Method in the Analysis of Iron Alloys (Kolorimetricheskiy metod v primeneni k analizu zheleznykh splavov)

PERIODICAL: Tr. Nauchno-tekhn. o-va chernoy metallurgii Ukr resp pravl, 1956. Vol 4 pp 32-37 Comments, p 38

ABSTRACT: The method, developed for the determination of small amounts of Mg in cast iron, is based on the formation of Mg hydroxy-quinolate followed by colorimetric analysis. A weighed portion of cast iron is dissolved in 50 cc of HCl (1:1). After oxidizing the solution with 2-3 cc of HNO₃ (specific gravity of 1.4) and evaporating it to dryness, HCl is added, and the resulting solution is boiled. After filtering out the precipitate, the filtrate is evaporated to dryness and the dry residue is treated with HCl. the basic amount of Fe is extracted with the aid of amylacetate. In order to remove the Fe entirely, 10 cc of 3% H₂O₂ are added together with an excess of a 25% solution of NH₄OH; the solution is heated for 15-20 minutes in a bath and is then filtered out. The

Card 1/2

137-58-5-11136

The Employment of the Colorimetric Method in the Analysis of Iron Alloys

combined filtrates are evaporated to dryness and heated in order to remove the ammonium salts. After treating the dry residue with H_2O , to which 3-5 drops of 2-N H_2SO_4 have been added, the MnO_2 which has separated out is filtered off. The Mg in the filtrate is precipitated by the action of a 2% alcohol solution of hydroxyquinoline in the presence of NaOH and sodium tartrate. The residue is dissolved in 0.1-N CH_3COOH and is analyzed colorimetrically. Another approach is also recommended: the solution, freed of Fe and other elements, is diluted to 100 cc; bromthymol blue is added and the solution is neutralized with a 2-N NH_4OH solution; Mg and Fe are then precipitated with the aid of a 2% alcohol solution of hydroxyquinoline. The Mg hydroxyquinolate of the filtrate is precipitated in an alkaline medium in the presence of tartrate. The precipitate is dissolved in 0.1-N solution of CH_3COOH and the Mg is analyzed colorimetrically. The relative error amounts to 1.5-3.5%. See also RzhMet, 1957, Nr 7, abstract 13656.

TITLE: Arbuzov rearrangement of triethylphosphite during its reaction with chlorine-containing polymers

SOURCE: Khimicheskiye svoystva i modifikatsiya polimerov (Chemical properties and the modification of polymers); sbornik statey. Moscow, Izd-vo Nauka, 1964, 151-155

TOPIC TAGS: Arbuzov rearrangement, triethylphosphite, chlorinated polymer, polyvinylchloroacetate, polyvinylchloride, acrylic acid chloroanhydride, methacrylic acid, polymethylchloroacrylate

ABSTRACT: Linear, phosphorus-containing polymers were obtained by the reaction of triethylphosphite with chlorine-containing polymers, such as polyvinylchloroacetate, polyvinylchloride, the polymer of the chloroanhydride of acrylic acid or methacrylic acid and polymethyl- α -chloroacrylate. The reaction schemes are given. Depending on time (50,75,100 hrs) and temperature (100,120,150C), polymers or copolymers with different phosphorus contents were obtained. The

Card 1/2

2

experimental data are tabulated. It was found that if the chlorine atom in the polymer was directly bound to the carbon of the main macromolecular chain, its reactivity in the Arbuzov rearrangement with triethylphosphite decreased considerably. This result agrees with the data available, according to which secondary alkylhalides do not initiate Arbuzov rearrangements, and is obviously explained by the low mobility of the Cl atom in polyvinylchloride. During the reaction of polyvinylchloride in dioxane, no isomerization of phosphite was found. The reaction of triethylphosphite with polyvinylchloroacetate and polymeric chloroanhydrides of acrylic and methacrylic acid gave linear polymeric derivatives of alkylphosphinic acid or their copolymers with the initial chloride (not previously described in the literature) with high degrees of conversion, 92-95%. The properties of these phosphorus-containing polymers were studied in detail. The conditions of preparation and polymerization of the various compounds are described in detail. Orig. art. has: 1 table and 3 formulas.

TITLE: A/method for protection of metal and concrete surfaces. Class 22, No. 167924 16
 16

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 3, 1965, 38

TOPIC TAGS: resin/ ED-5 resin, ED-6 resin

ABSTRACT: This Author's Certificate introduces a method for protecting metal and concrete surfaces by the application of a primer based on ED-5¹²resin, a hardener and filler followed by the application of a finish coat based on ED-6 resin with a hardener and filler. The coating surface is then toughened by heating to 140°C. In order to prevent extraction of the hardener from the lacquer surface by nutritive atmospheres [sic], a three-step process is used in hardening: first 20°C for 12 hours, then 60°C for 3 hours and finally 140°C for 3 hours.

AUTHOR: Shchel'nov, V.A.

TITLE: Many-valued Linear Operators in a Locally Convex Space

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 132, No. 1, pp 75-77

TEXT: Let X and Y be locally convex spaces. Every set of the product (X, Y) can be understood as a diagram Γ_A of a certain operator A with the region of definition $D_A \subset X$ and the range of values $R_A \subset Y$. A is called linear if Γ_A is a linear set. A linear operator A is called open if transfers every zero neighborhood in D_A into a zero neighborhood of R_A . Let the closure \bar{A} of A be defined as an operator the diagram of which is the closure of the diagram of A . If M is a vector space in X , X^* is the space conjugated to X , then M^0 denotes a vector space in X^* which is orthogonal to M . In five long theorems the author formulates several properties of the considered operators, e.g.:

Theorem 4: Let X be a Frechet-space; let M and N be vector subspaces in X ; M_1 and N_1 - vector subspaces in X^* .

1°. If $M + N$ is closed, then $M^0 + N^0$ is weakly closed;

TITLE: On the Problem of X-ray Influence on Electric Conductance
(K voprosu o vliyaniyakh rentgenovskikh luchey na elektroprovodnost')

PERIODICAL: Izv. Tomskogo politekhn. inst., 1958, Vol 91, pp 391-398

ABSTRACT: Electric conductance of natural NaCl single crystals has been studied under the influence of x-rays of various intensities and at various temperatures. In nonirradiated specimens, the electric conductance is due to ions, and the effect of temperature on conductance obeys an exponential law. Under irradiation conditions, an electronic component of conductance is added, this component being larger with lower temperature and higher intensity of irradiation. As the ionic current grows very quickly with temperature increase, while the electronic current grows slowly, no effect of x-ray on electric conductance of a NaCl crystal has been observed at high temperatures. Bibliography: 18 items. Tomskiy politekhn. inst. (Tomsk Polytechnic Institute), Tomsk.

PURPOSE: This booklet is intended for the general reader interested in the
industrial growth of the Moldavian SSR.

COVERAGE: This book is divided into 14 sections each dealing with a different
branch of industry in the Moldavian SSR. The author describes the development
and growth of industry in this area especially from 1940 to 1956. Special
emphasis is placed on light industry and the food industry. There are no
personalities mentioned. No references are given.

Radialy sovetskikh uchebnykh. [i.e.] Khimika radioisotopov i radiatsionnykh prevrashcheniy (Reports of Soviet Scientists. V. 4: Chemistry of Radioelements and Radiation Transformations) Moscow, Atomizdat, 1959. 383 p. 8,000 copies printed. (Series: Its: Trudy)

Ed. (Title page): A. P. Vinogradov, Academician; Ed.: V. I. Lebedev; Tech. Ed.: Ye. I. Masel'.

PURPOSE: This collection of articles is intended for scientists and engineers interested in the applications of radioactive materials in science and industry.

COVERAGE: The book contains 26 separate studies concerning various aspects of the chemistry of certain radioactive elements and the processes of radiation effect on matter. These reports discuss present-day methods of reprocessing irradiated nuclear fuel, research in the chemistry of mercury, thorium, uranium, plutonium, and americium, problems related to the sorption and burying of radioactive wastes, the radiolysis of aqueous solutions and of organic compounds, the mechanism of polymer chain grafting, and the effect of radiation on natural and synthetic rubbers. V. I. Prusakov edited the present volume. Most of the reports are accompanied by references. Contributors to individual investigations are mentioned in annotations to the Table of Contents.

AUTHORS: Ellert, G. V., Shchelokov, R. N. (Abstracters) SOV/78-4-5-46/46

TITLE: The Chemistry of the Actinide Elements, Josef I. Katz, Glehn T. Seaborg, London 1957 (Dzh. Kats, G. Siborg. Khimiya aktinidnykh elementov, London, 1957)

PERIODICAL: Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 5, pp 1217-1221 (USSR)

ABSTRACT: This article is a criticism and short description of the book mentioned in the title, which is a revised edition of the book "Actinide Elements" published in 1954 and edited by the authors of the present work (translated into Russian in 1955). The technological part of the book was extended (compared to the earlier edition); it deals with the separation and purification of actinide elements, the authors basing upon the material obtained at the I. International Conference on the Peaceful Uses of Atomic Energy. A short summary is given of the contents of each chapter. The last chapter, which deals with trans-curie elements which are discussed individually, is also in the new edition dealt with in detail, and the elements Bk, Cf, E, Mv, and 102 (nobelium) are discussed. After discussion of the contents, it is further pointed-

Card 1/2

SOV/78-4-5-46/46
The Chemistry of the Actinide Elements, Josef I. Katz, Glenn T. Seaborg,
London 1957

ed out that the last element (102) was obtained also in the Soviet Union by G. N. Flerov by the intense bombardment of Pu^{241} by fivefold-charged O^{16} -ions. In conclusion, the book is described as being of value not only for a systematical investigation of the chemistry and technology of actinide elements, but that it is also an excellent textbook for students wishing to devote special attention to the field of the chemistry of nuclear materials. A translation into the Russian language is recommended.

TITLE: Aquo-oxalato Sulfate Compounds of Uranyl

PERIODICAL: Zhurnal neorganicheskoy khimii, 1960, Vol. 5, No. 7,
pp. 1454 - 1466

TEXT: The main results of this study were submitted to the Second International UNO Conference on the Peaceful Use of Atomic Energy. The authors first point out the difficulties involved in the synthesis of mixed acido complexes of uranyl which account for the scarceness of data available. In the work concerned here the authors started by investigating the possibility of substituting addenda by others (for the purpose of finding the rules governing relationships), and obtained the following series: CO_3^{2-} , F^- , $\text{C}_2\text{O}_4^{2-}$, SO_4^{2-} . On the basis of the result obtained, the mixed acido complexes were synthesized by addition reactions. The authors started from $\text{UO}_2\text{C}_2\text{O}_4 \cdot 3\text{H}_2\text{O}$ which was reacted with alkali sulfate, and obtained the oxalate-sulfate compounds of UO_2 . For comparison, pure

Card 1/4

Aquo-oxalato Sulfate Compounds of Uranyl

S/078/60/005/007/022/043/XX
B004/B060

oxalate complexes were synthesized from uranyl oxalate and alkali oxalate, and pure sulfate complexes from uranyl sulfate and alkali sulfate. The following compounds were obtained: 1) $K_2[UO_2(C_2O_4)(SO_4)(H_2O)_2] \cdot H_2O$. The thermogram of this compound allows two effects to be identified: separation of the three H_2O molecules at $70 - 125^\circ C$, and destruction of the oxalate groups at $305 - 320^\circ C$. At $150^\circ C$, this substance loses all three H_2O molecules, which, however, are again added on standing in the air; this was confirmed both gravimetrically and analytically (Table 2). 2) $K_2[UO_2(C_2O_4)_2(H_2O)_2] \cdot H_2O$. This compound loses all three water molecules at $110^\circ C$. Two H_2O molecules are added stepwise on standing in the air, but not the third one. 3) $K_2[UO_2(SO_4)_2(H_2O)_2]$. In these three potassium compounds, a decrease in stability of the inner sphere of the complex ion was observed with an increase in molecular electrical conductivity.
